

ZYTO EVOX

PERCEPTION REFRAMING

Using a process known as perception reframing, the EVOX system helps clients discover a whole new way of seeing things. Here's how it works.

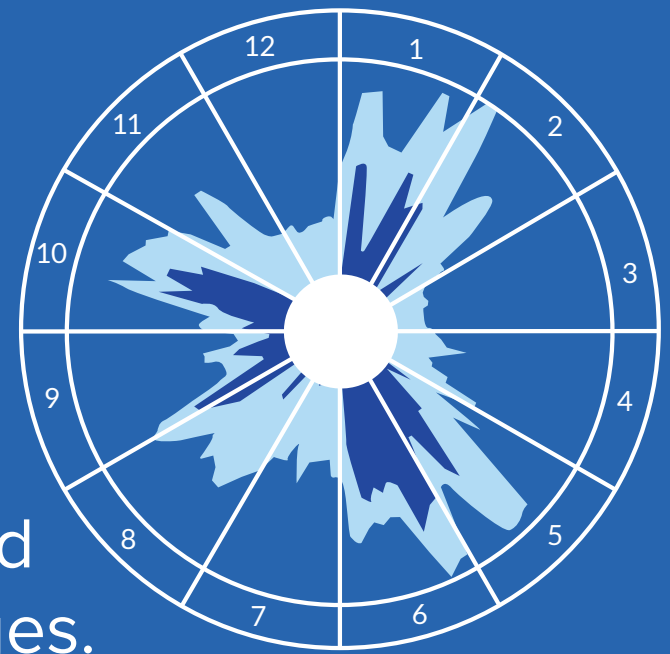

1 RECORDING

EVOX records a 10-second slice of your voice & displays it visually as a Perception Index (PI).

2 PERCEPTION INDEX

The Perception Index shows the energy pattern of your voice. The Perception Index is divided into 12 zones, allowing you to identify and consider potential blockages.

3 BIOSURVEY

Using a stimulus response exchange called a biosurvey, EVOX scans information options and selects those that you respond to most favorably.

4 INFORMATION INPUT

EVOX processes that information while you rest your hand on the Hand Cradle & think about the topic you just spoke about.

5 REPETITION

The process of reading the voice and processing information is repeated several times throughout the session. As missing information is incorporated, the voice pattern will change and the perception will be reframed.

6 REFRAMED PERCEPTIONS

Perception reframing leads to new ways of seeing things, more options for dealing with life, and improved realities.
